

bunsanweb

A proof of concept for decentralized web

bunsanweb is a collection of technologies created to realize the concept of a "Web of Programs".

- As endpoints, make JavaScript running browser tabs hyperlinkable
- Hyperlink as a first-class object with metadata and HTML as a container of hyperlinks
- Mapping linked Resources for URL semantics on each endpoint script, from local to universal
- Federating a single universal stream for the open events shared by emergent endpoints

bunsanweb: topics

Decentralizing the Web

- Our view of the Web
- Web of something
- Views toward decentralization
- Our view of decentralizing the Web

About "bunsanweb"

- What "bunsanweb" tackles
- What we've made
- bunsanweb: endpoint-scripting
- bunsanweb: universal event stream
- bunsanweb: endpoint-relative hyperlinked space

With bunsanweb

- Change with bunsanweb: open systems built on peer relations
- Connect to decentralized technologies

bunsanweb: keywords

We choose

- **User-Agent** makes Resources independent
 - not Web Servers for controlling Resources
- **End-to-end** principle
 - not gathered in the middle
- Enhance from **Endpoint**
 - not from specific intermediaries
- Web of (**hyperlinked**) Programs
 - not accessing data structures via RPC
- **Endpoint-scripting**
 - not separating client-side and server-side functionalities
- **Universal** event stream
 - not pre-registered channels
- **Endpoint-relative** hyperlinked space
 - not data of accounts on global Web Services
- Scripting with JavaScript and other **standard browser APIs**
 - not specialized API objects for each functionality
- HTML as a **hyperlink container**
 - not document formats without URL type (or just a string)
- **Content-based** events shared on a universal stream
 - not temporal event data in siloed channels
